

Connecting to the WebDAV server

For connecting with the WebDAV protocol you may use any WebDAV-enabled Client.

Here an example in Ubuntu 9.10:

FAQ

If WebDAV fails with *403 Forbidden*, the apache webserver maybe denies WebDAV-methods like PROPFIND. In Ubuntu you have to comment out the LIMIT-sections in the file `/etc/apache2/mods-available/userdir.conf`.

```
sudo vi /etc/apache2/mods-available/userdir.conf
```

This section disables WebDAV in userdirs:

```
Order deny,allow  
Deny from all
```
